

XCHARGE

Additive for natural lime

XCHARGE facilitates the application of plaster in thick layers, which is often necessary to level old, uneven walls.

Properties

- Light, slightly granular powder that gives a mix strong thixotropic properties.
- Its main characteristic is that it retains water and air in the mortar, always in the same proportion.
- Allows manual layers up to 4 cm, and 7cm or more when machine-applied.

Special recommendations

- Do not add too much water at the start, so you can more easily achieve the desired plasticity later.
- First mix the product dry with the sand in the concrete mixer, before adding the binder, the required water, and the other additives.
- For optimal performance, the XCHARGE mortar must always remain pasty.

Use

- Makes it possible to level old walls in a single layer.
- Suitable for filling holes.
- Allows the application of thicker layers of lime or cement plasters in one pass.

Cleaning

- With water.

Packaging

- 70g doses (buckets containing 50 doses)
